---

Dolly the cloned sheep had one big problem: her telomeres were **too short**. This sign of aging suggested that Dolly may already have been old at birth. But now a paper in the 28 April *Science* reports that calves cloned by nuclear transfer from senescent cells have cells that look younger than normal (Lanza et al. *Science* 2000, 288:665-669). The cloned cells have long telomeres and can divide more times in culture than their counterparts from normal calves. Somehow the egg cell is bestowing this youthfulness on the old donor nucleus. This ability may be species-specific, or dependent on the cell type or nuclear-transfer method. But if the resetting mechanism can be reproduced *in vitro*, outside of the egg cell, it would allow replacement tissues to be produced for patients without the need for ethically questionable cloning experiments.
